Platforms of Excellence for the Industry of the Future

IMT Atlantique has built a network of technical and service platforms in the energy, environment and digital life sectors, which are the three pillars of its training and research. These platforms are supported, for the most part, by teaching and research departments.

The platforms are open to a variety of partnerships (for example, access to testing facilities, expertise, software design, technological manufacturing, project development, etc). They are intended to be a real accelerator of know-how and technology transfer, particularly in the field of the industry of the future.

With these goals in mind, the platforms offer varied and adapted modes of collaboration, with a large degree of flexibility when it comes to the management of industrial property in particular. Their main objective is to support industrial development, particularly of SMEs, through the transfer of know-how, training and familiarisation with the technologies and methods of the industry of the future.
